

# JD Edwards EnterpriseOne

Orchestrator For Tools Release 9.2

# You own Orchestrator, are you using it?

Orchestrator can transform the EnterpriseOne system from a transaction-based system of records into a system that provides a dynamic reflection of your real-time business operations.

Orchestrator is available (for free) to all EnterpriseOne users with Tools release 9.2.

## **Harness the Internet of Things**

Orchestrator enables IoT-enabled devices and machines to become users of EnterpriseOne applications. As they feed data to the orchestrations, your JD Edwards system stays up-to-date and accurate without user intervention.

## **Simplified Orchestration Development**

Orchestrator enables a business analyst to create, test, and deploy orchestrations. Analysts can even capture the key processes just by recording the steps while using EnterpriseOne applications.

## **Harness the Digital Economy**

Orchestrator also integrates with external systems and Cloud services, allowing your EnterpriseOne system to send and receive data for integrated business processes.

## **Less Human Involvement**

Orchestrating your key business processes opens the door for extreme automation, integration with external systems and devices, less repetitive, mundane work for users, fewer errors, lower costs, and better business data.

# Orchestrator is a key component of your JD Edwards digital platform.
